## Problem Statement

A G.P consists of an even number of terms. If the sum of all terms is 5 times the sum of terms occupying odd places, then find its common ratio.

## Solution

Parameter	Description
$n$	Number of terms in the G.P (positive even integer)
$x(0)$	first term in the G.P
$r$	common ratio in the G.P
$x(n)$	nth term in the G.P
$X(z)$	Z transform of X(n)

$$x(n) = x(0)r^n \quad (1)$$

$$X(z) = \frac{x(0)}{1 - rz^{-1}} \quad (2)$$

$$S(z) = X(z)U(z) \quad (3)$$

$$= \frac{x(0)}{(1 - rz^{-1})(1 - z^{-1})} \quad |z| > |r| \quad (4)$$

$$= \frac{x(0)(\frac{r}{1-rz^{-1}} - \frac{1}{1-z^{-1}})}{(r-1)} \quad (5)$$

The inverse of S(z) is s(n) which is:

$$s(n) = x(0)(\frac{r^{n+1} - 1}{r - 1})u(n) \quad (6)$$

$v(n) = x(2m), v(0) = x(0)$ , where  $m$  is an integer.  
if  $x(n)$  changed to  $x(n/k)$  then  $X(z)$  changes to  $X(z^k)$

as  $k = 1/2$  we can write

$$V(z) = X(z^{1/2}) \quad (7)$$

The sum of terms in odd places:

$$V_o(z) = \frac{v(0)}{1 - r^2 z^{-1}} \quad (8)$$

$$S_o(z) = V_o(z)U(z) \quad (9)$$

$$= \frac{v(0)}{(1 - r^2 z^{-1})(1 - z^{-1})} \quad |z| > |r| \quad (10)$$

$$= \frac{v(0) \left( \frac{r}{1 - r^2 z^{-1}} - \frac{1}{1 - z^{-1}} \right)}{(r^2 - 1)} \quad (11)$$

The inverse of  $S_o(z)$  is  $s_o(n)$  which is:

$$s_o(n) = v(0) \left( \frac{r^{n+1} - 1}{r^2 - 1} \right) u(n) \quad (12)$$

Then from (6) and (11)

$$v(0) \left( \frac{r^{n+1} - 1}{r - 1} \right) u(n) = 5v(0) \left( \frac{r^{n+1} - 1}{r^2 - 1} \right) u(n) \quad (13)$$

$$r^2 - 5r + 4 = 0 \quad (14)$$

$$r = 1 \quad \text{or} \quad r = 4 \quad (15)$$
