PROBLEM STATEMENT

A G.P consists of an even number of terms. If the sum of all terms is 5 times the sum of terms occupying odd places, then find its common ratio.

SOLUTION

Parameter	Description
n	Number of terms in the G.P
$x(0)$	first term in the G.P
r	common ratio in the G.P
$x(n)$	nth term in the G.P
$y(n)$	sum of G.P series
$w(n)$	sum of terms in odd places

TABLE I

INPUT PARAMETERS

Solving the Question in time domain:

$$n = 2m \quad (1)$$

$$x(n) = x(0)r^{2m} \quad (2)$$

$$y(n) = x(0) \left(\frac{r^{2m+1} - 1}{r - 1} \right) u(2m) \quad (3)$$

$$Y(z) = \frac{x(0)}{(1 - rz^{-1})(1 - z^{-1})} \quad (4)$$

The sum of terms in odd places:

$$w(n) = x(0) \left(\frac{r^{2m+1} - 1}{r^2 - 1} \right) u(2m) \quad (5)$$

where $r \neq \pm 1$

$$W(z) = \frac{x(0)}{(1 - rz^{-\frac{1}{2}})(1 - z^{-1})} \quad (6)$$

Then from (3) and (7)

$$x(0) \left(\frac{r^{2m+1} - 1}{r - 1} \right) u(2m) = 5x(0) \left(\frac{r^{2m+1} - 1}{r^2 - 1} \right) u(2m) \quad (7)$$

$$r^2 - 5r + 4 = 0 \quad (8)$$

$$r = 4 \quad (9)$$
